Extremality Measure

## Oriented Sub-Orthants $C_x^{\vec{u}}$

Extremality Measure

Oriented Sub-Orthants 
$$\mathcal{C}_n^{ec{u}}$$

Given a unit director vector  $\vec{u} \in \mathbb{R}^n$  and a vertex  $v \in \mathbb{R}^n$ ; a Oriented Sub-Orthant  $C_v^{\vec{u}}$  is the convex cone given by

$$\mathcal{C}_{v}^{\vec{u}} = \left\{ x \in \mathbb{R}^{n} \mid \mathcal{R}_{\vec{u}}(x-v) \ge 0 \right\}.$$
(1)

The inequality in (1) is componentwise.

Considering the case in  $\mathbb{R}^2$  with  $\vec{u} = [u_1, u_2]'$  and the vertex  $v = \begin{pmatrix} v_1 \\ v_2 \end{pmatrix}$ ,

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

Considering the case in  $\mathbb{R}^2$  with  $\vec{u} = [u_1, u_2]'$  and the vertex  $v = \begin{pmatrix} v_1 \\ v_2 \end{pmatrix}$ ,  $\mathcal{C}_v^{\vec{u}} = \left\{ \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \in \mathbb{R}^2 : \frac{\sqrt{2}}{2} \begin{pmatrix} u_1 + u_2 & u_2 - u_1 \\ u_1 - u_2 & u_1 + u_2 \end{pmatrix} \begin{pmatrix} x_1 - v_1 \\ x_2 - v_2 \end{pmatrix} \ge \begin{pmatrix} 0 \\ 0 \end{pmatrix} \right\}.$ 

(日) (日) (日) (日) (日) (日) (日)

Considering the case in  $\mathbb{R}^2$  with  $\vec{u} = [u_1, u_2]'$  and the vertex  $v = \begin{pmatrix} v_1 \\ v_2 \end{pmatrix}$ ,  $\vec{u} = \begin{pmatrix} x_1 \\ v_2 \end{pmatrix}$ ,  $\vec{u} = \begin{bmatrix} x_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} x_2 \\ v_2 \end{bmatrix} \begin{pmatrix} x_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} x_2 \\ v_2 \end{bmatrix} \begin{pmatrix} x_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ v_2 \end{bmatrix} =$ 

$$\mathcal{C}_{v}^{\vec{u}} = \left\{ \left( \begin{array}{c} x_{1} \\ x_{2} \end{array} \right) \in \mathbb{R}^{2} : \frac{\sqrt{2}}{2} \left( \begin{array}{c} u_{1} + u_{2} & u_{2} - u_{1} \\ u_{1} - u_{2} & u_{1} + u_{2} \end{array} \right) \left( \begin{array}{c} x_{1} - v_{1} \\ x_{2} - v_{2} \end{array} \right) \geq \left( \begin{array}{c} 0 \\ 0 \end{array} \right) \right\}.$$

(日) (日) (日) (日) (日) (日) (日)

In  $\mathbb{R}^2$ , the director vector  $\vec{u}$  can be determined by an angle  $0 \le \theta \le 2\pi$  as  $\vec{u} = [\cos \theta, \sin \theta]'$  that indicates the direction of the cone.

Considering the case in  $\mathbb{R}^2$  with  $\vec{u} = [u_1, u_2]'$  and the vertex  $v = \begin{pmatrix} v_1 \\ v_2 \end{pmatrix}$ ,

$$\mathcal{C}_{v}^{\vec{u}} = \left\{ \left( \begin{array}{c} x_{1} \\ x_{2} \end{array} \right) \in \mathbb{R}^{2} : \frac{\sqrt{2}}{2} \left( \begin{array}{c} u_{1} + u_{2} & u_{2} - u_{1} \\ u_{1} - u_{2} & u_{1} + u_{2} \end{array} \right) \left( \begin{array}{c} x_{1} - v_{1} \\ x_{2} - v_{2} \end{array} \right) \geq \left( \begin{array}{c} 0 \\ 0 \end{array} \right) \right\}$$

In  $\mathbb{R}^2$ , the director vector  $\vec{u}$  can be determined by an angle  $0 \le \theta \le 2\pi$  as  $\vec{u} = [\cos \theta, \sin \theta]'$  that indicates the direction of the cone.

$$\left\{ \left(\begin{array}{c} x_1\\ x_2 \end{array}\right) \in \mathbb{R}^2 : \left(\begin{array}{c} \cos(\theta - \frac{\pi}{4}) & \sin(\theta - \frac{\pi}{4})\\ -\sin(\theta - \frac{\pi}{4}) & \cos(\theta - \frac{\pi}{4}) \end{array}\right) \left(\begin{array}{c} x_1 - v_1\\ x_2 - v_2 \end{array}\right) \ge \left(\begin{array}{c} 0\\ 0 \end{array}\right) \right\}$$

## **Extremality Measure**

#### Definition (Extremality Measure)

The Extremality of  $x \in \mathbb{R}^n$  respect to a distribution function F in direction  $\vec{u}$  is a mapping  $\mathcal{E}_{\vec{u}}(x, F) : \mathbb{R}^n \times \mathfrak{F} \longrightarrow R^+ \cup \{0\}$ , defined by

$$\mathcal{E}_{\vec{u}}(x,F) = 1 - P_{x,\vec{u}},$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ - つへつ

where  $P_{x,\vec{u}}$  is given by  $P_F(\mathcal{C}_x^{\vec{u}})$ .

## **Extremality Measure**

#### **Definition (Extremality Measure)**

The Extremality of  $x \in \mathbb{R}^n$  respect to a distribution function F in direction  $\vec{u}$  is a mapping  $\mathcal{E}_{\vec{u}}(x, F) : \mathbb{R}^n \times \mathfrak{F} \longrightarrow R^+ \cup \{0\}$ , defined by

$$\mathcal{E}_{\vec{u}}(x,F) = 1 - P_{x,\vec{u}},$$

where  $P_{x,\vec{u}}$  is given by  $P_F(\mathcal{C}_x^{\vec{u}})$ . A natural estimator for  $\mathcal{E}_{\vec{u}}(x,F)$  is given by

$$\mathcal{E}_{\vec{u}}(x,\hat{F}) = 1 - \frac{1}{m} \sum_{j=1}^{m} \mathbb{1}_{\{x_j, \in \mathcal{C}_x^{\vec{u}}\}} = 1 - \frac{1}{m} \sum_{j=1}^{m} \mathbb{1}_{\{\mathcal{R}_{\vec{u}}(x_j - x) \ge 0\}},$$

where  $x_1, \ldots, x_m$  is a sample of the random vector X, that is, 1the proportion of the point cloud that belong to  $C_x^{\vec{u}}$ .

-Extremality Measure

## **Extremality Measure**

High extremality of a point x means that the convex cone C<sup>*i*</sup><sub>x</sub> contains a small part of the total mass and possibly x belongs to some tail of the distribution. -Extremality Measure

## **Extremality Measure**

- High extremality of a point x means that the convex cone C<sup>*i*</sup><sub>x</sub> contains a small part of the total mass and possibly x belongs to some tail of the distribution.
- Hence, high extremality can be interpreted as "farness" regarding distribution

Extremality Measure

### **Properties**

#### Property For any $x_0 \in \mathbb{R}^n$ and any absolutely continuous $F \in \mathfrak{F}$

 $\mathcal{E}_{\vec{u}}(x_0, F)$  is continuous in  $\vec{u}$ .

Extremality Measure

### **Properties**

### Property For any $x_0 \in \mathbb{R}^n$ and any absolutely continuous $F \in \mathfrak{F}$

 $\mathcal{E}_{\vec{u}}(x_0, F)$  is continuous in  $\vec{u}$ .

#### Property

$$\mathcal{E}_{\vec{u}}(x,F) \leq \mathcal{E}_{\vec{u}}(x^*,F) \quad \text{for all } x^* \in \mathcal{C}_x^{\vec{u}}$$

Extremality Measure

## **Properties**

### Property

Let X be a n- multivariate random variable with distribution function F. Let A a n-orthogonal matrix and let b be a vector in  $\mathbb{R}^n$ . Then

$$\mathcal{E}_{A\vec{u}}(Ax+b,F_{AX+B}) = \mathcal{E}_{\vec{u}}(x,F_X)$$

Multivariate Value at Risk

#### **Extremality Measure**

Multivariate Value at Risk

◆□ > ◆□ > ◆臣 > ◆臣 > ─ 臣 ─ のへで

#### Suppose that F is the loss distribution and $\alpha \in [0,1]$ then

$$VaR_{\alpha}(X) := \inf\{x \in \mathbb{R} \mid F(x) \ge \alpha\}.$$

#### Suppose that F is the loss distribution and $\alpha \in [0,1]$ then

 $VaR_{\alpha}(X)$ 

#### A natural idea to study risk for portfolio vectors

 $X = (X_1, \ldots, X_n)$ 

is to consider a function  $f : \mathbb{R}^n \longrightarrow \mathbb{R}$  and one-dimensional risk measure on f(X).

#### A natural idea to study risk for portfolio vectors

 $X = (X_1, \dots, X_n)$ 

is to consider a function  $f : \mathbb{R}^n \longrightarrow \mathbb{R}$  and one-dimensional risk measure on f(X).

• The *VaR* of the joint portfolio is that associated to f(X).

#### A natural idea to study risk for portfolio vectors

$$X = (X_1, \dots, X_n)$$

is to consider a function  $f : \mathbb{R}^n \longrightarrow \mathbb{R}$  and one-dimensional risk measure on f(X).

- The *VaR* of the joint portfolio is that associated to f(X).
- In Burgert and Rüschendorf (2006),

$$f(X) = \sum_{i=1}^{n} X_i$$
 or  $f(X) = \max_{i \le n} X_i$ .

However, directions as  $\vec{u} = \frac{1}{\sqrt{n}} [\pm 1, \dots, \pm 1]'$  and principal components can be interesting in financial applications.

(日本) (日本) (日本) (日本)

However, directions as  $\vec{u} = \frac{1}{\sqrt{n_1}} [\pm 1, \dots, \pm 1]'$  and principal components can be interesting in financial applications.

$$VaR_{0.05}^{\frac{1}{\sqrt{2}}[-1,-1]}(X)$$

However, directions as  $\vec{u} = \frac{1}{\sqrt{n}} [\pm 1, \dots, \pm 1]'$  and principal components can be interesting in financial applications.

Given  $\{x_1 \ldots, x_m\}$ 

Given  $\{x_1 \ldots, x_m\}$ 

$$S_{\alpha}^{\vec{u}}(F_m) = \left\{ x_i : \mathcal{E}_{\vec{u}}\left(x_i, \hat{F_m}\right) = 1 - \alpha \right\}.$$

However, it may be possible that  $S^{\vec{u}}_{\alpha}(F_m) = \emptyset$ .

Given  $\{x_1 \ldots, x_m\}$ 

$$S_{\alpha}^{\vec{u}}(F_m) = \left\{ x_i : \mathcal{E}_{\vec{u}}\left(x_i, \hat{F_m}\right) = 1 - \alpha \right\}.$$

However, it may be possible that  $S^{\vec{u}}_{\alpha}(F_m) = \emptyset$ .

$$S_{\alpha,h}^{\vec{u}}(F_m) = \left\{ x_i : \left| \mathcal{E}_{\vec{u}}\left(x_i, \hat{F}_m\right) - 1 + \alpha \right| \le h \right\},\$$

where h is a slack.

$$S^{\vec{u}}_{\alpha}(F_m) \subset S^{\vec{u}}_{\alpha,h}(F_m).$$

Given  $\{x_1 \ldots, x_m\}$ 

$$S_{\alpha}^{\vec{u}}(F_m) = \left\{ x_i : \mathcal{E}_{\vec{u}}\left(x_i, \hat{F_m}\right) = 1 - \alpha \right\}.$$

However, it may be possible that  $S^{\vec{u}}_{\alpha}(F_m) = \emptyset$ .

$$S_{\alpha,h}^{\vec{u}}(F_m) = \left\{ x_i : \left| \mathcal{E}_{\vec{u}} \left( x_i, \hat{F}_m \right) - 1 + \alpha \right| \le h \right\},\$$

where h is a slack.

$$S^{\vec{u}}_{\alpha}(F_m) \subset S^{\vec{u}}_{\alpha,h}(F_m).$$

The direction given by  $\vec{u}$  can have influence in the estimation of  $S^{\vec{u}}_{\alpha,h}(F_m)$ .

To estimate  $VaR^{\vec{u}}_{\alpha}(X),$  we propose to change the original coordinates. Suppose

$$S^{\vec{u}}_{\alpha,h}(F) = \{x_1, x_2 \dots, x_k\}.$$

This set is transformed to

To estimate  $VaR^{\vec{u}}_{\alpha}(X)$ , we propose to change the original coordinates. Suppose

$$S^{\vec{u}}_{\alpha,h}(F) = \{x_1, x_2 \dots, x_k\}.$$

This set is transformed to

$$\mathcal{R}_{\vec{u}}S^{\vec{u}}_{\alpha,h}(F) = \{\mathcal{R}_{\vec{u}}x_1, \mathcal{R}_{\vec{u}}x_2\dots, \mathcal{R}_{\vec{u}}x_k\}.$$
