## fd\_gauss\_vasicek1d\_capfloor

### Input parameters:

- Space StepNumber  $N_r$
- Time StepNumber  $M$

### Output parameters:

- Price

The stochastic differential equation representing the short rate is given by

$$dr_t = k(\theta - r_t)dt + \sigma dW(t)$$

The price of the zero-coupon bond with maturity  $S > T$  is solution of the following PDE

$$u_t + \frac{1}{2}\sigma^2 u_{rr} + [k(\theta - r)]u_r - ru = 0, u(r, S, S) = 1$$

that we solve using Crank-Nicholson scheme. We apply Dirichlet boundary conditions at  $r = r_{min}$  and  $r = r_{max}$ . The price of the option is obtained solving the same PDE with boundary condition at the maturity of the option  $T$ , the price of the Zero Coupon Bond. A cap(floor) is equivalent to a portfolio of European zero-coupon Put(Call)-Options.
