

Programming Concurrency

Cédric Pasteur <cedric.pasteur@ens.fr>

PARKAS Team

Département d'Informatique, Ecole normale supérieure, Paris

27 févr. 2013

What is concurrency?

Demo

Language-based approach

Programming

- ▶ Programming Languages Design
 - Domain-specific Languages (DSL)
- ▶ New abstractions
 - Expressivity
 - Safety
 - Efficiency

Compilation

- ▶ Static analysis, Typing
- ▶ Efficient code generation

(Some) Concurrent Systems

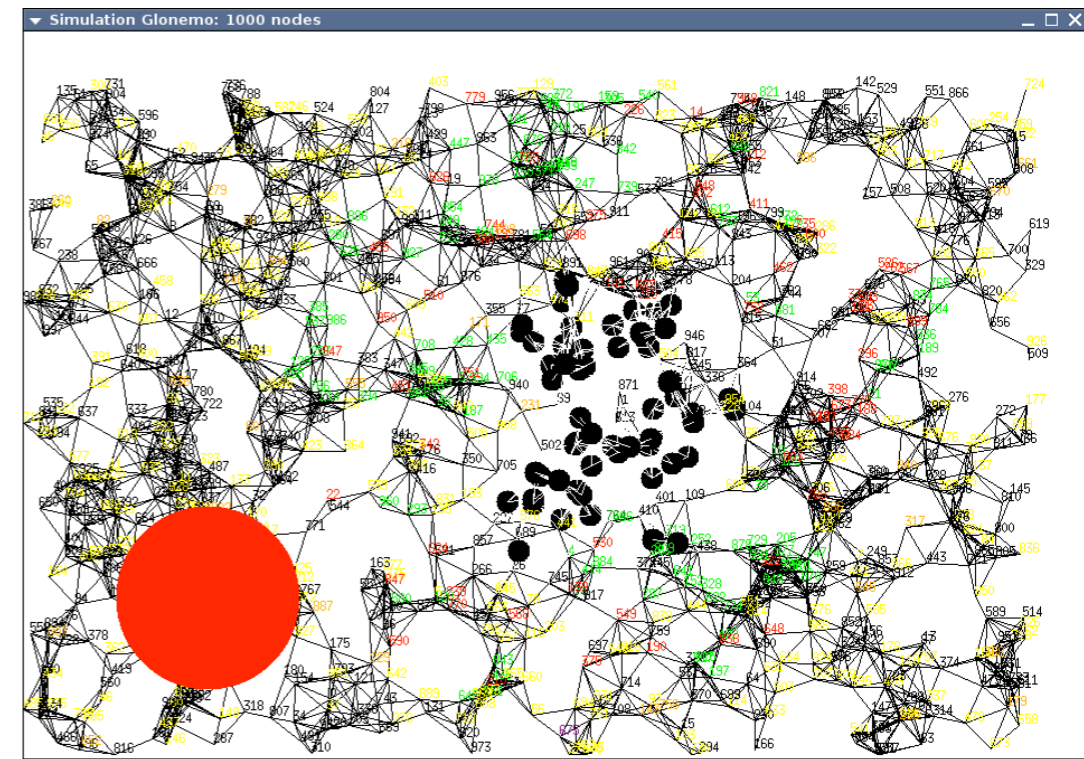

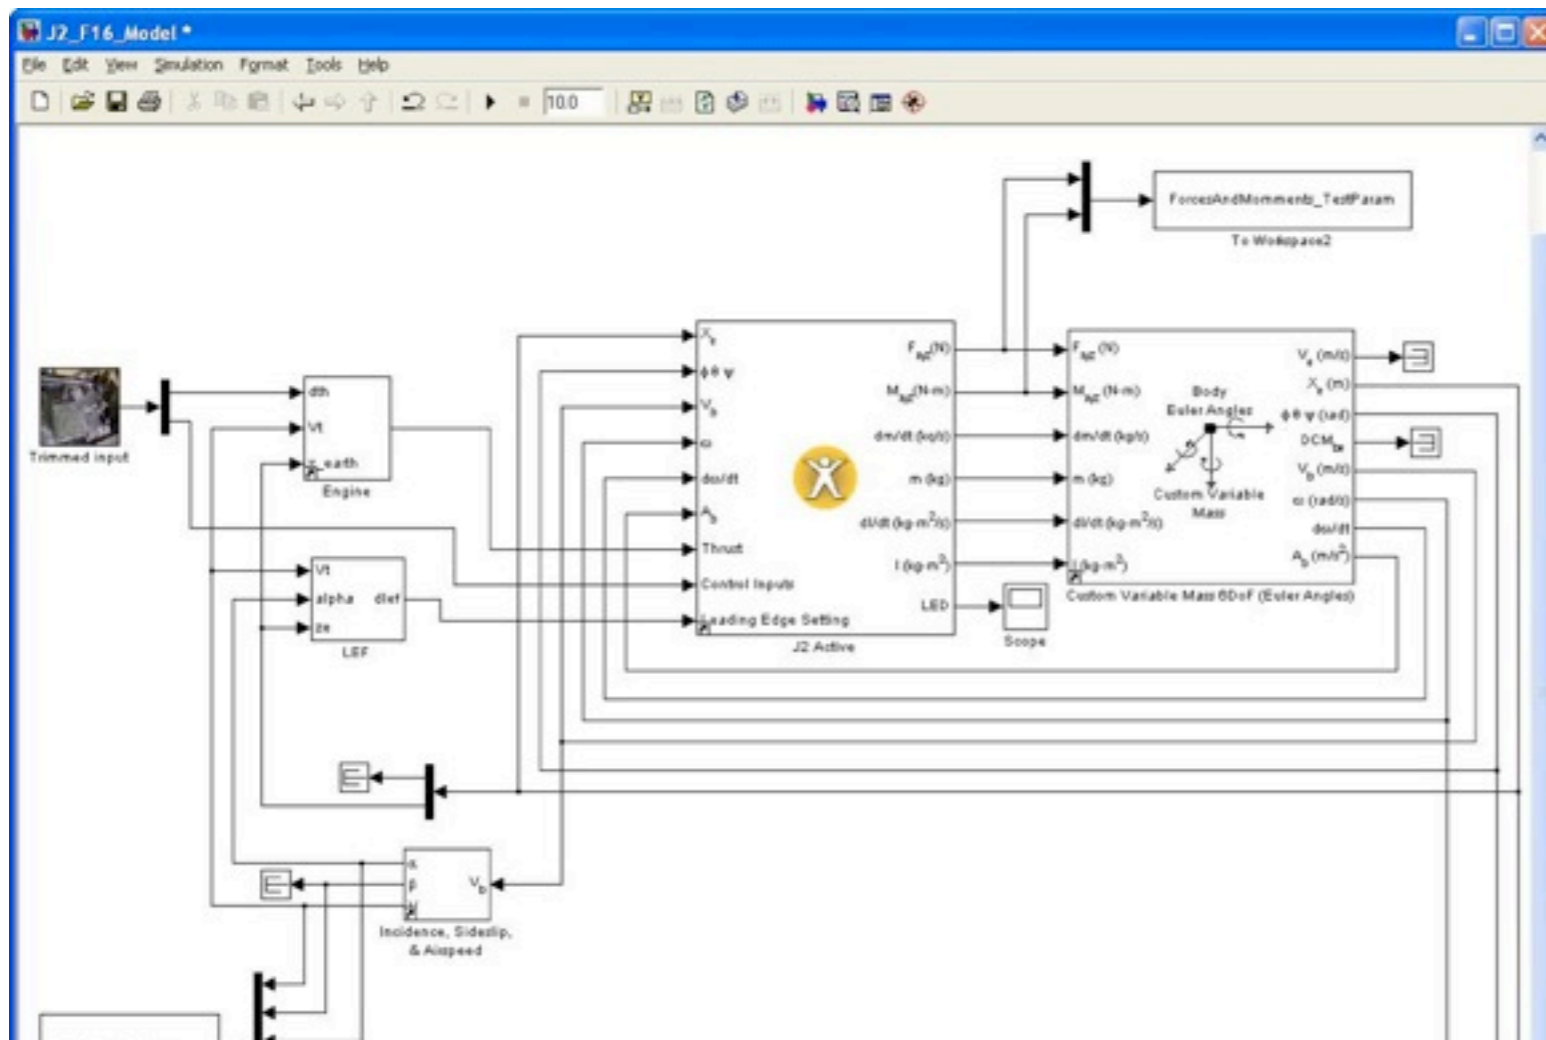

Embedded Systems

Simulation of embedded systems

Hybrid (ODE) (Simulink , Modelica)

Discrete

Concurrency \neq Parallelism

Concurrency = Model

- ▶ Doing several things at the same time
- ▶ Does not require hardware parallelism

Parallelism = Implementation

- ▶ Multi-core
- ▶ Going faster
- ▶ Implementation

Introduction

Synchronous languages

Beyond embedded systems: ReactiveML

My work: Time refinement

Introduction

Synchronous languages

Beyond embedded systems: ReactiveML

My work: Time refinement

Synchronous languages

Domain-specific languages for embedded systems

- ▶ Created in the 80's in France
 - Lustre (Caspi & Halbwachs, Grenoble)
 - Signal (Benveniste & Le Guernic, Rennes)
 - Esterel (Berry & Gonthier, Sophia)

Principles

- ▶ Time
- ▶ Deterministic Concurrency
- ▶ Mathematical foundations (= Semantics)
 - Formal verification

Synchronous languages

Programming embedded systems

- ▶ Reactive
- ▶ Real-time
- ▶ Critical

Interaction loop

- ▶ Read inputs (sensors)
- ▶ Compute
- ▶ Write outputs (actuators)

The synchronous hypothesis

Time

- ▶ Discrete
- ▶ Logical
- ▶ Global

The synchronous hypothesis

Computation and communication are instantaneous

- ▶ Computer is infinitely fast

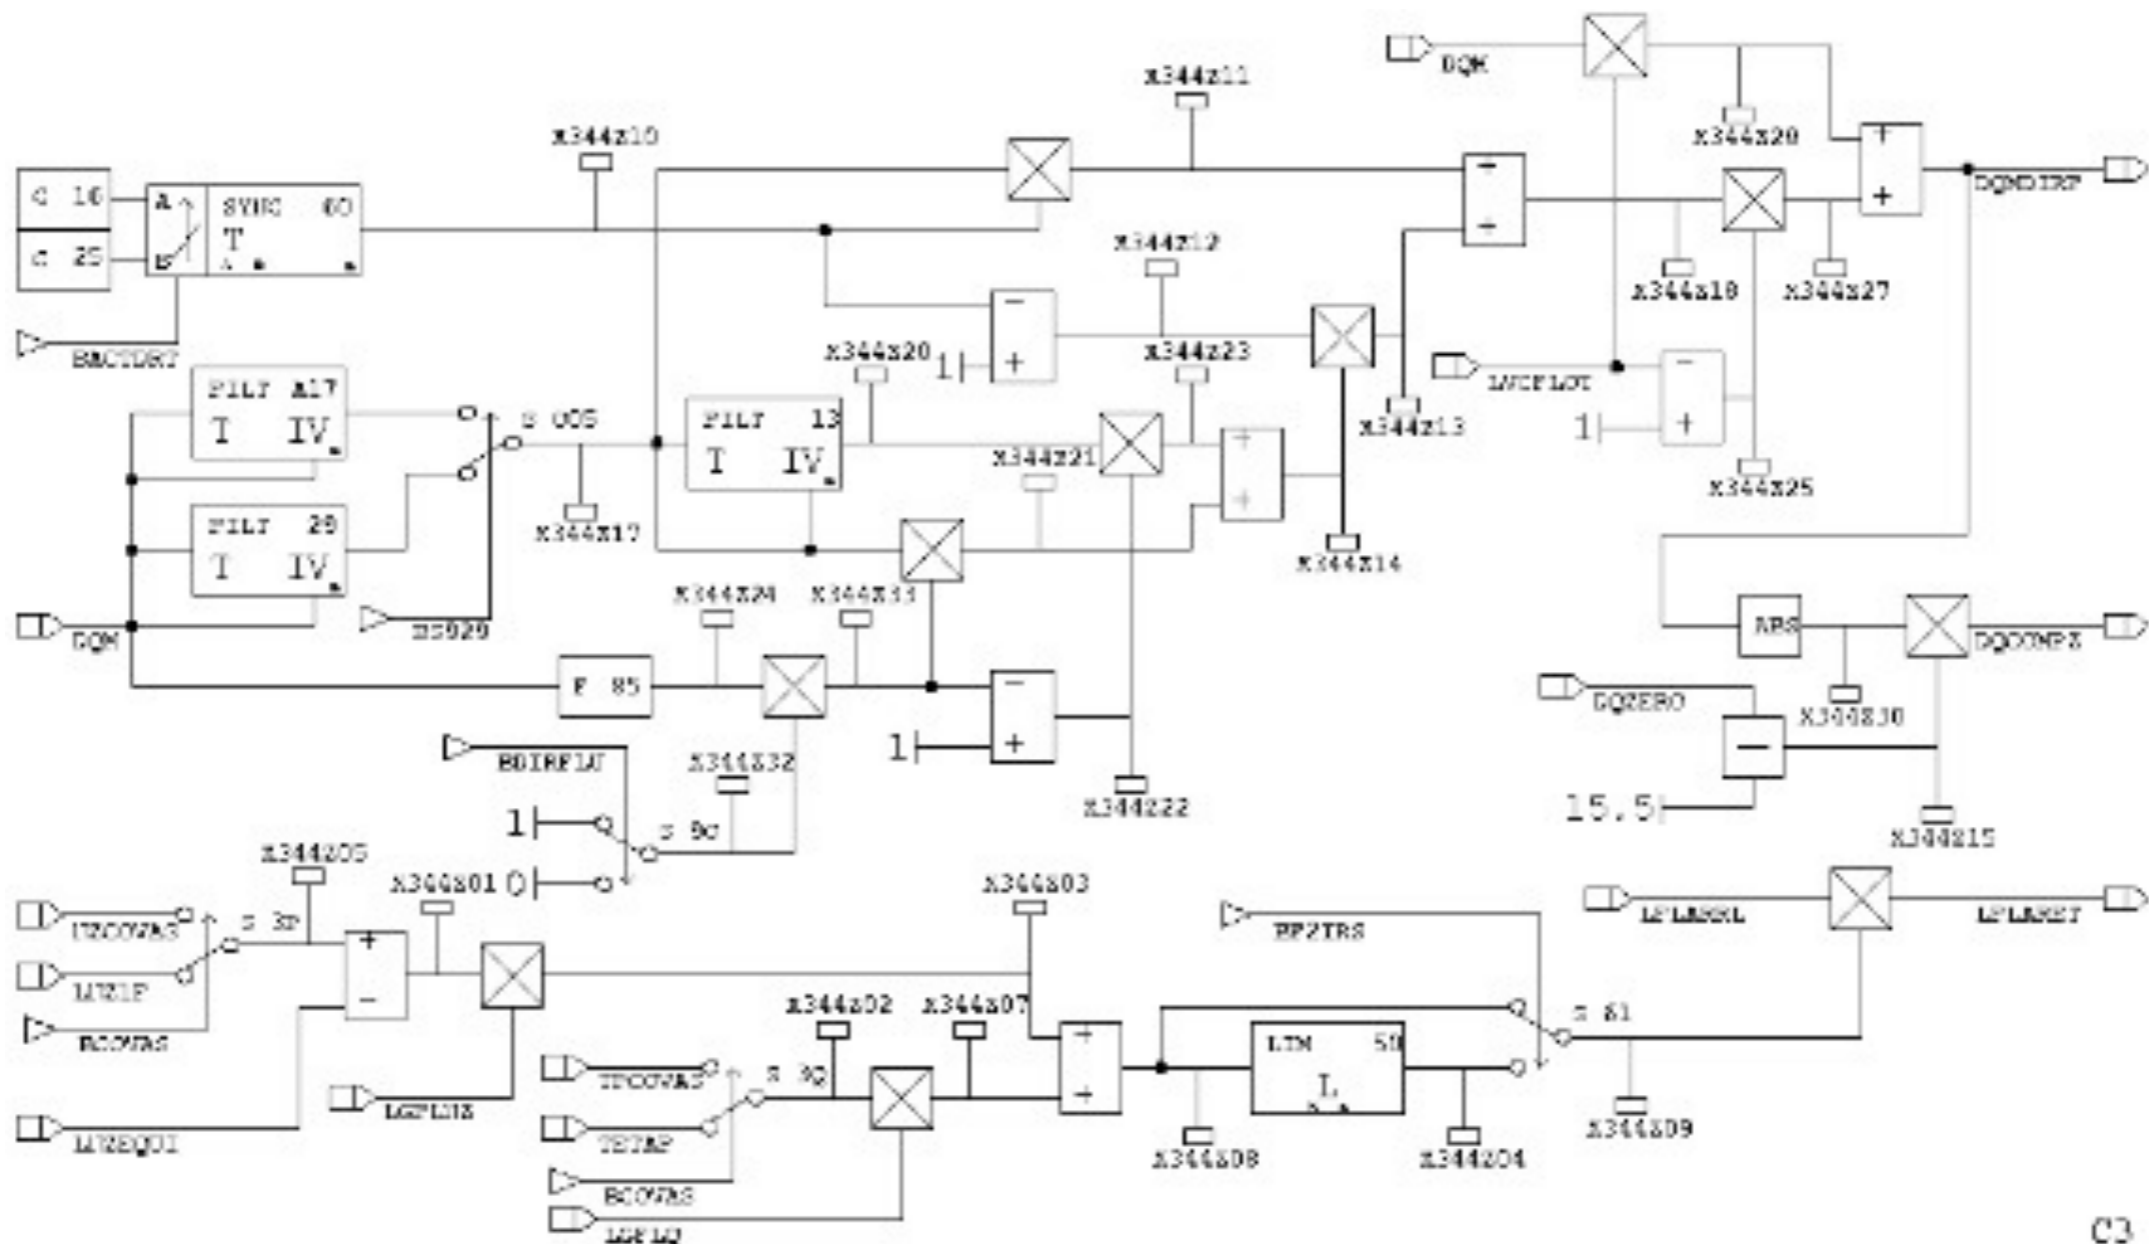

The synchronous hypothesis

Computation and communication are instantaneous

- ▶ Computer is infinitely fast
- ▶ Check if hypothesis holds

Computer assisted specification (Airbus, 80's)

C3

Synchronous data-flow language

- ▶ Equations on flows (= infinite sequence)

Example

- ▶ A counter

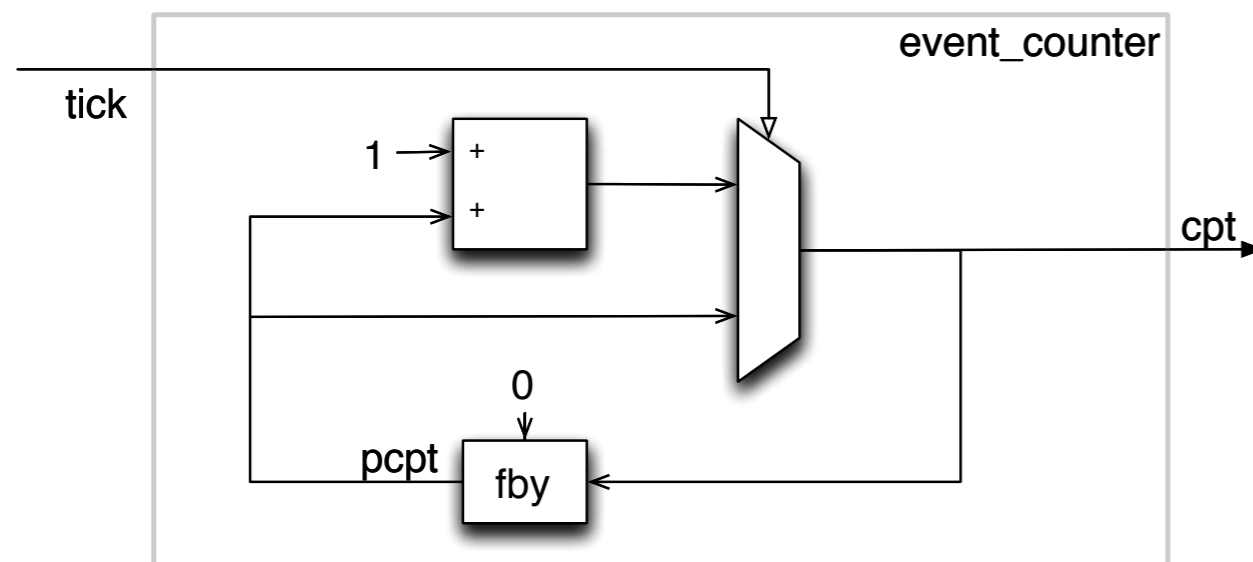

Synchronous data-flow language

- ▶ Equations on flows (= infinite sequence)

Example

- ▶ A counter

$$\begin{aligned}
 pcpt_0 &= 0 \\
 pcpt_{i+1} &= cpt_i \\
 cpt_i &= \begin{cases} pcpt_i + 1 & \text{if } tick_i \\ pcpt_i & \text{otherwise} \end{cases}
 \end{aligned}$$

Synchronous data-flow language

- ▶ Equations on flows (= infinite sequence)

Example

- ▶ A counter

```
node event_counter
  (tick:bool) = (cpt:int)
var pcpt:int;
let
  pcpt = 0 fby cpt;
  cpt = if tick
        then pcpt + 1
        else pcpt;
tel
```

$$pcpt_0 = 0$$
$$pcpt_{i+1} = cpt_i$$
$$cpt_i = \begin{cases} pcpt_i + 1 & \text{if } tick_i \\ pcpt_i & \text{otherwise} \end{cases}$$

Code generation

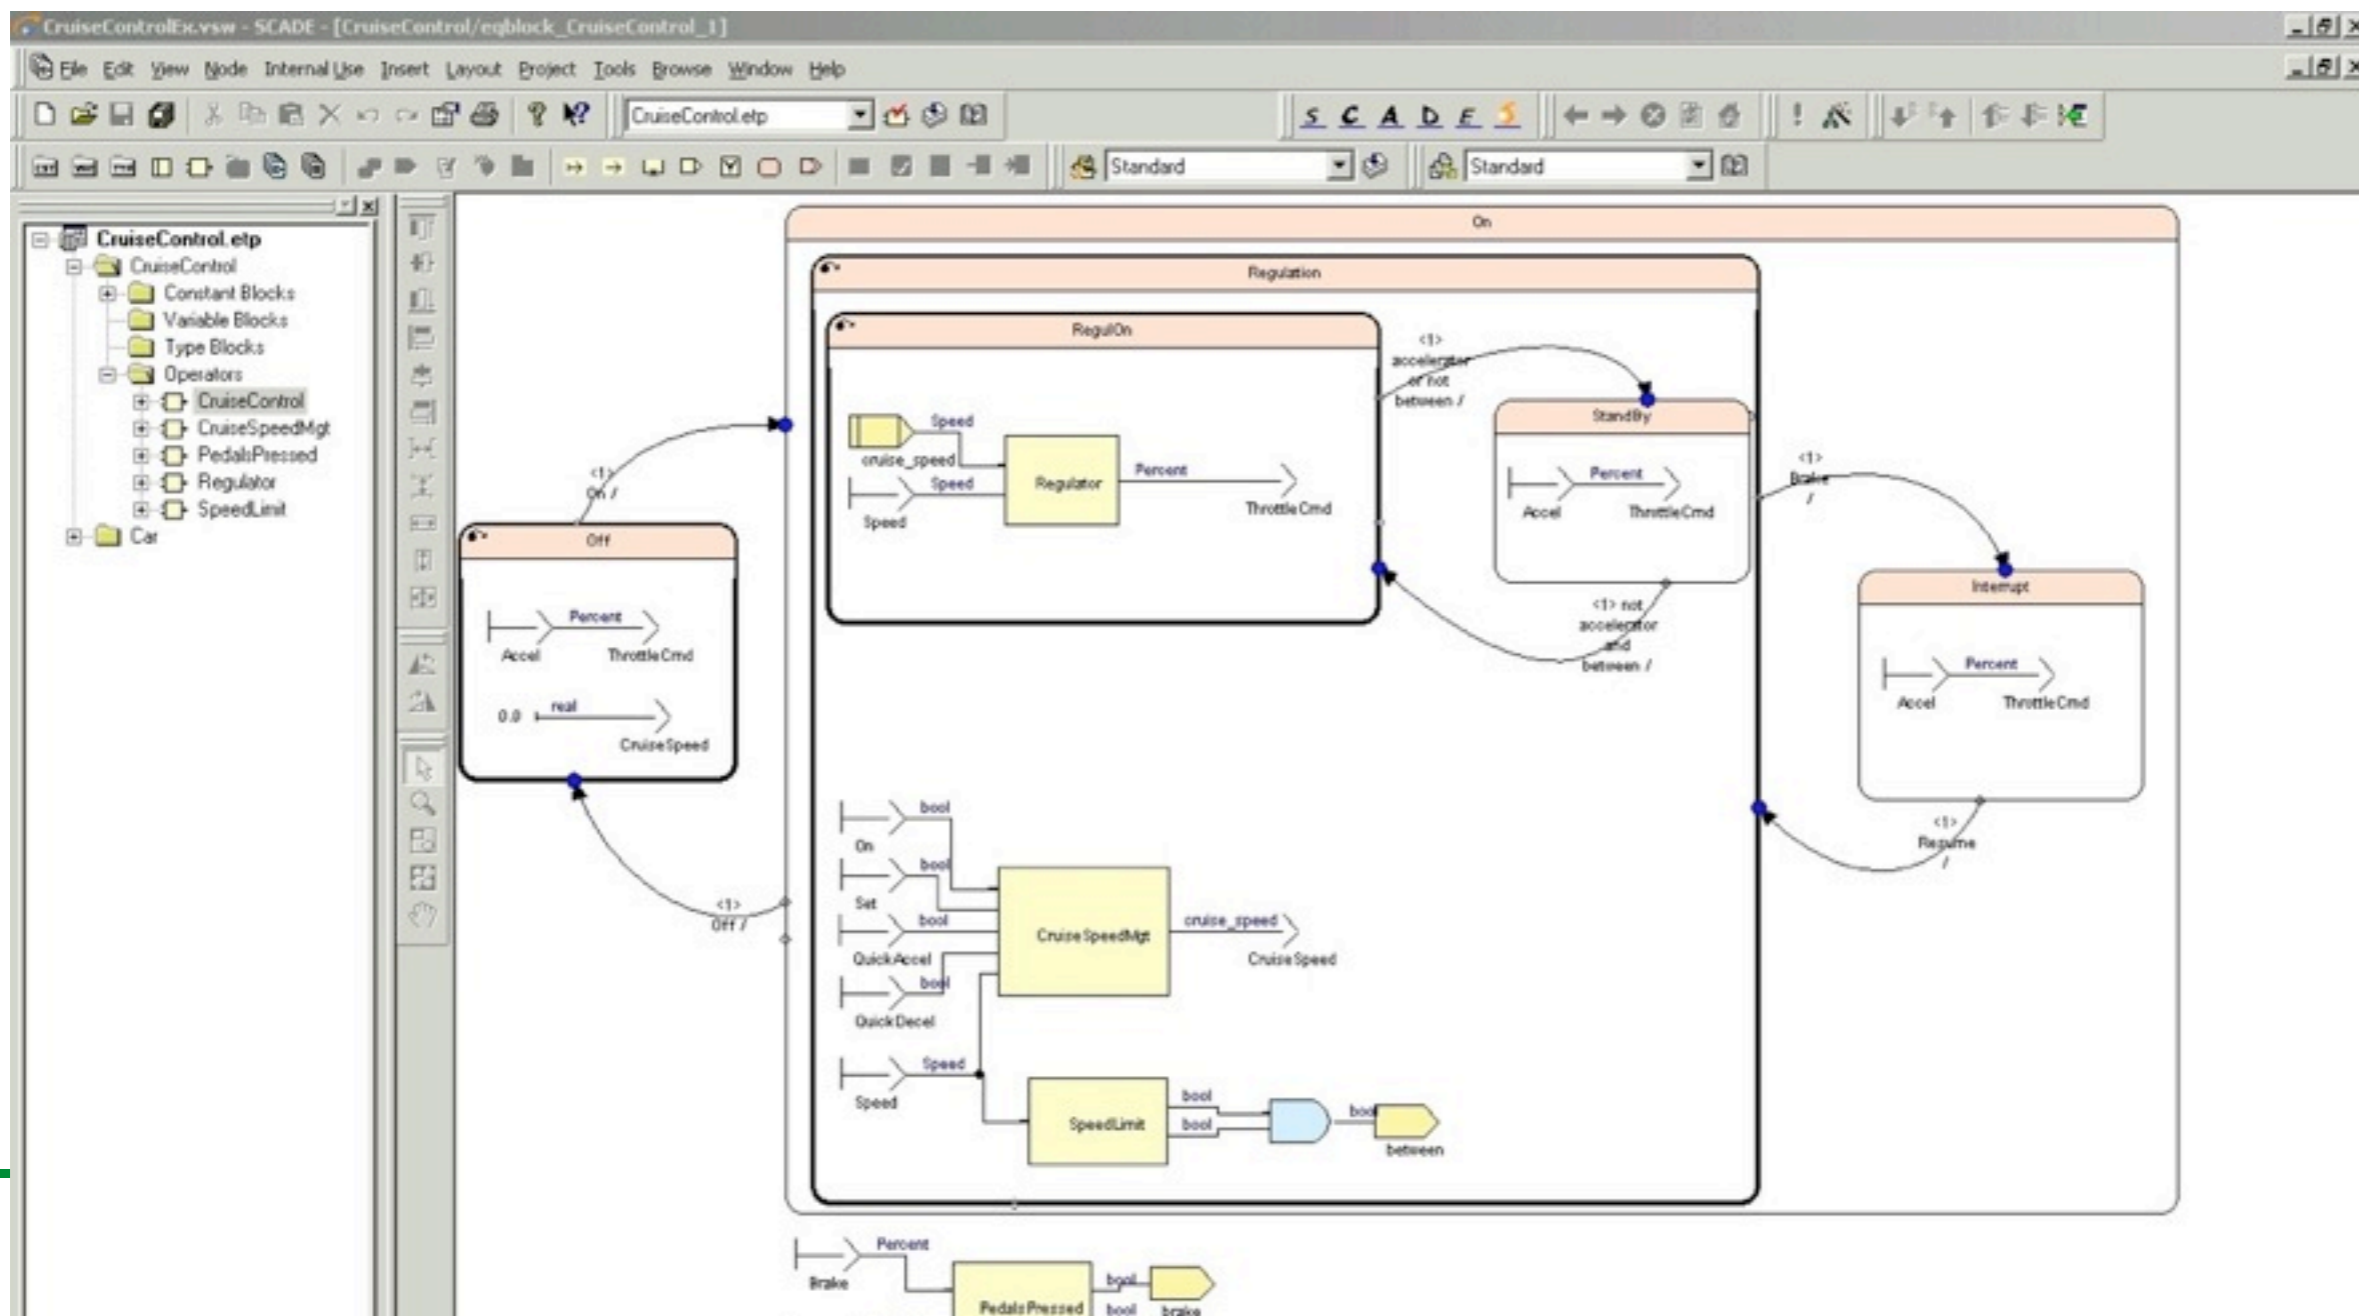

- ▶ Sequential code
- ▶ Efficient
- ▶ Bounded time (WCET) and memory

Formal verification

- ▶ Model-checking

Safety-critical embedded systems

- ▶ Plane, trains, subways, nuclear plants
- ▶ Certified/Qualified (DO-178B, IEC 61508, etc.)

Introduction

Synchronous languages

Beyond embedded systems: ReactiveML

My work: Time refinement

Synchrony in a general-purpose language

- ▶ No real-time
- ▶ Dynamic creation

ReactiveML

- ▶ Functional language (ML, OCaml)
- ▶ Synchronous model of concurrency
 - Discrete logical time
 - Communication by broadcast

Application

- ▶ Discrete simulation

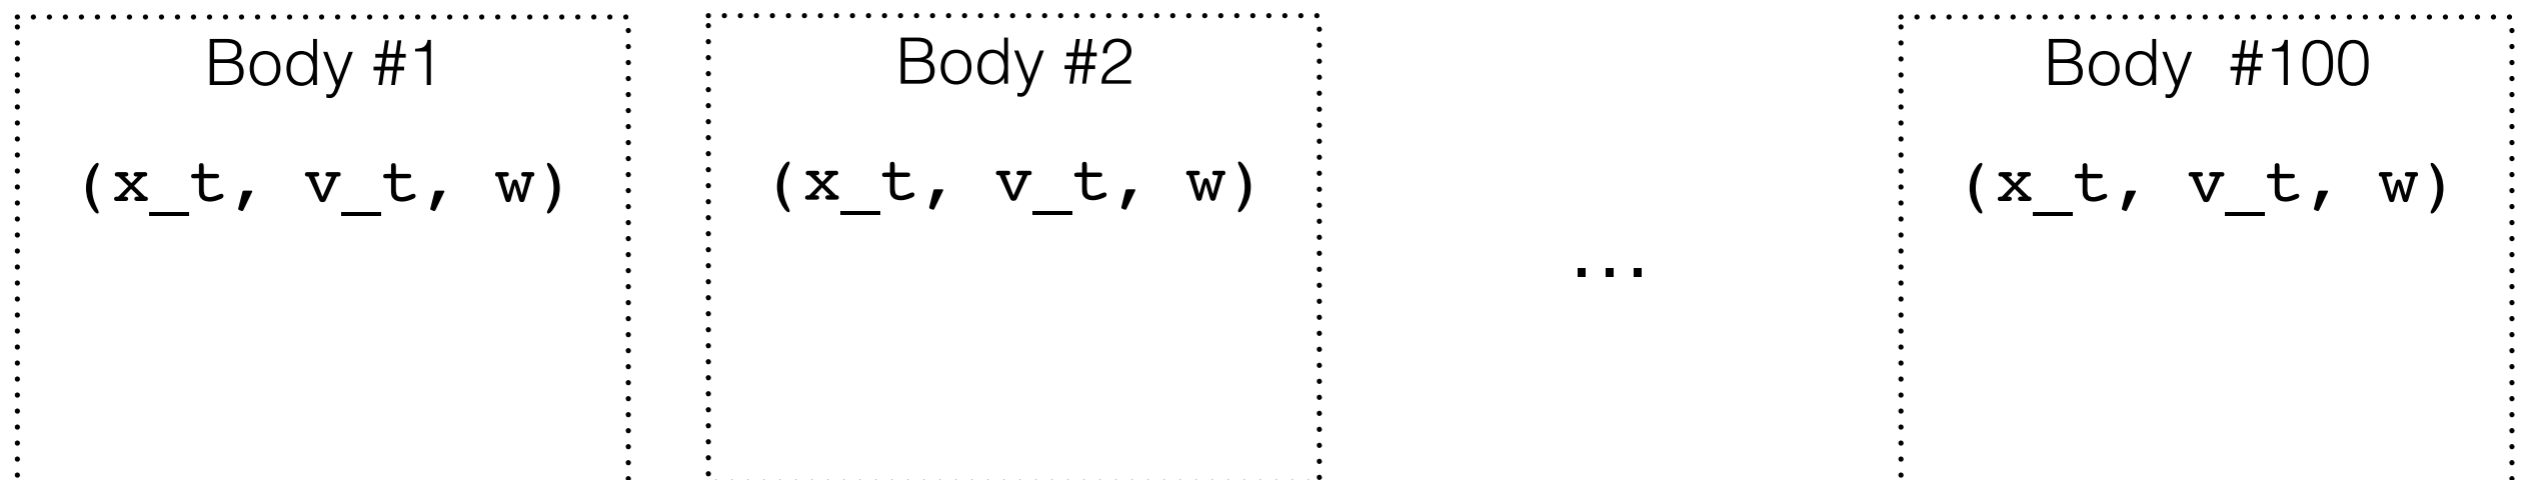

n-body problem

- ▶ Simulate the gravitational interactions of n bodies
- ▶ Numerical integration methods

$$m_i \vec{a}_i = \vec{f}_i = \sum_j \vec{F}_{i,j}$$

N-body in ReactiveML

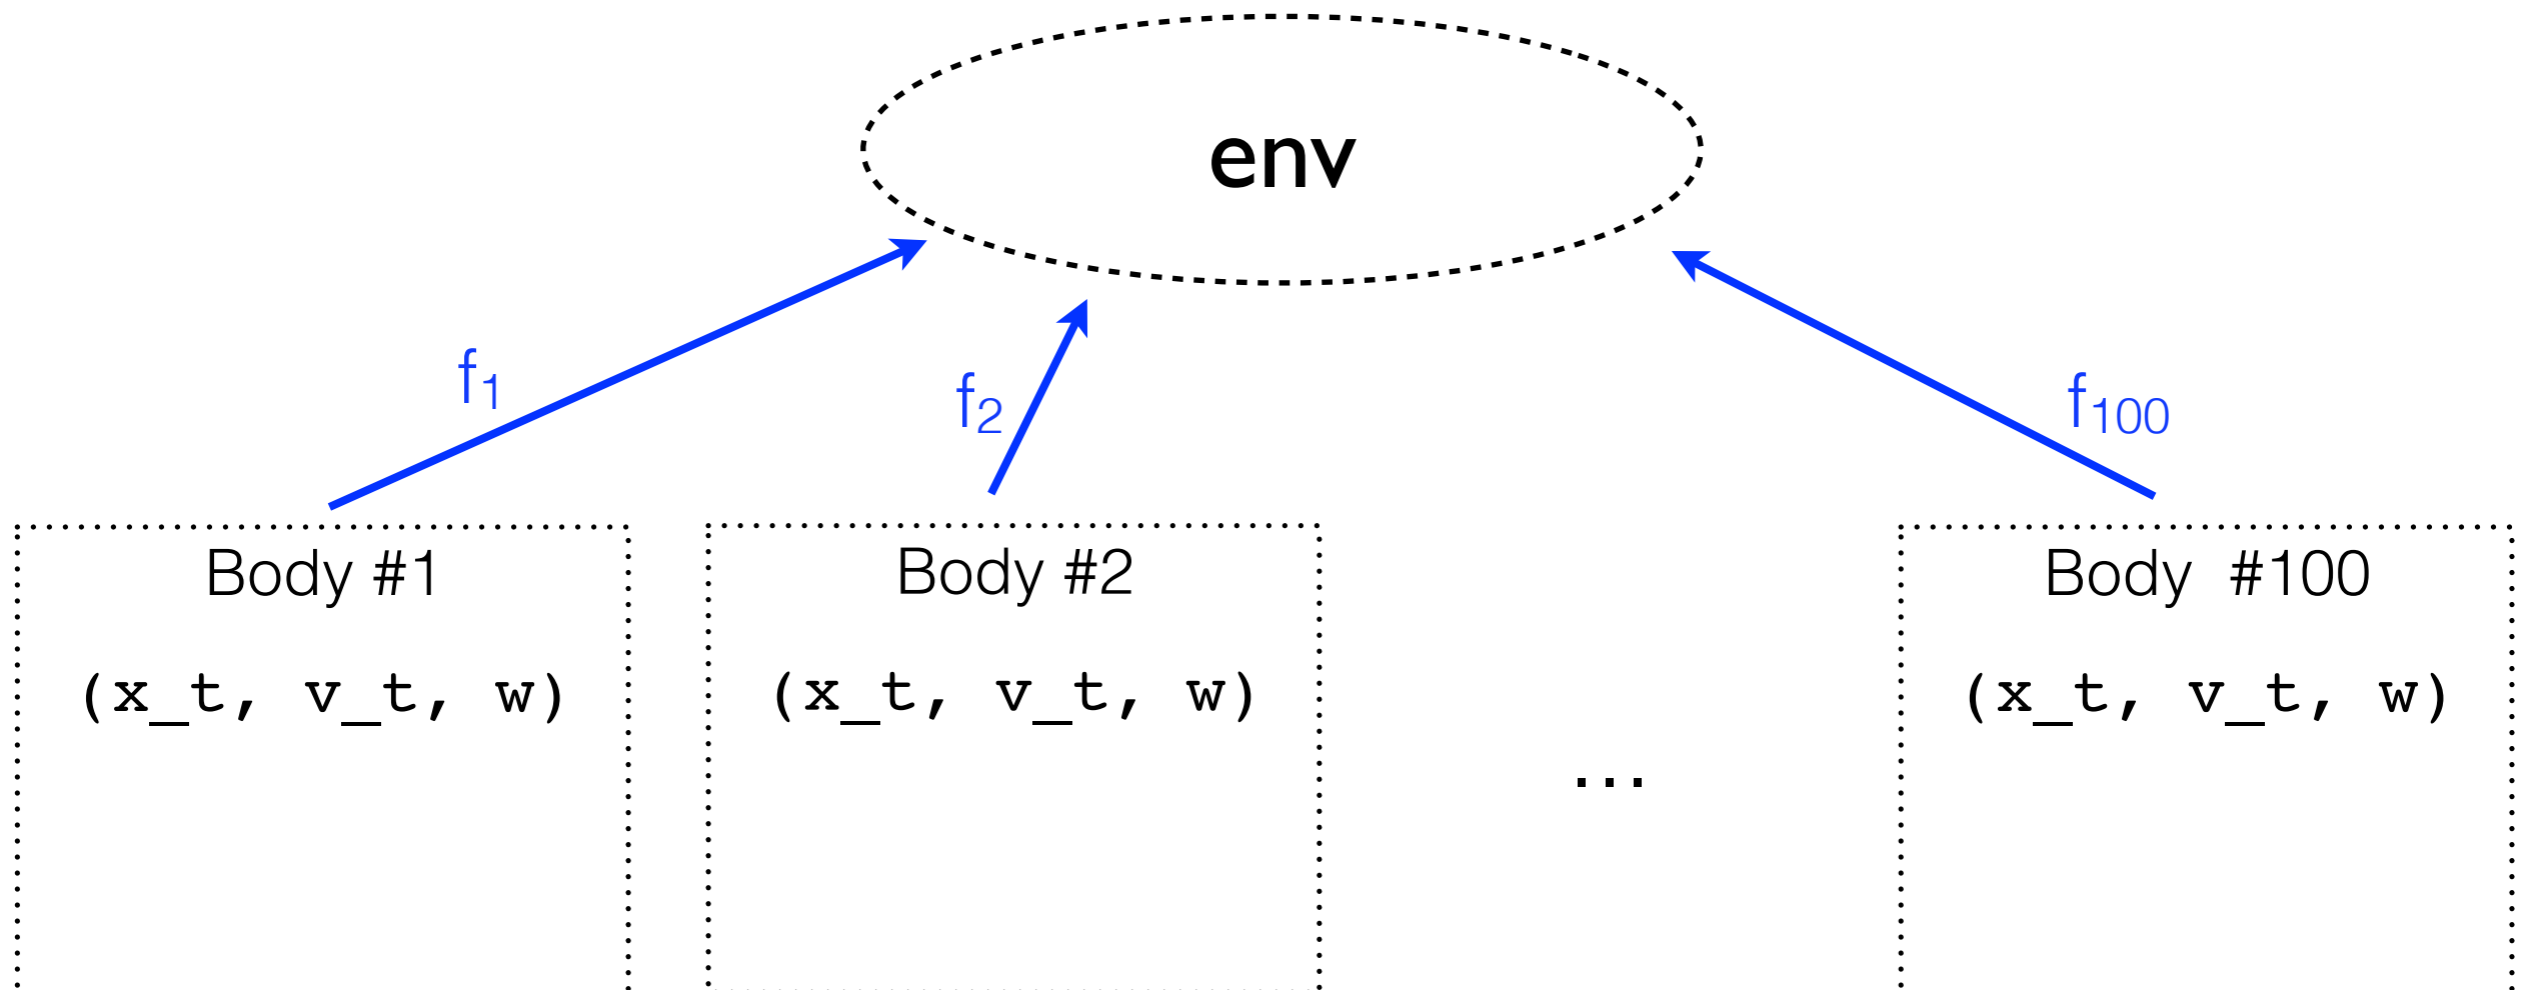

- ▶ One process per body
- ▶ A global signal

N-body in ReactiveML

1. Send force

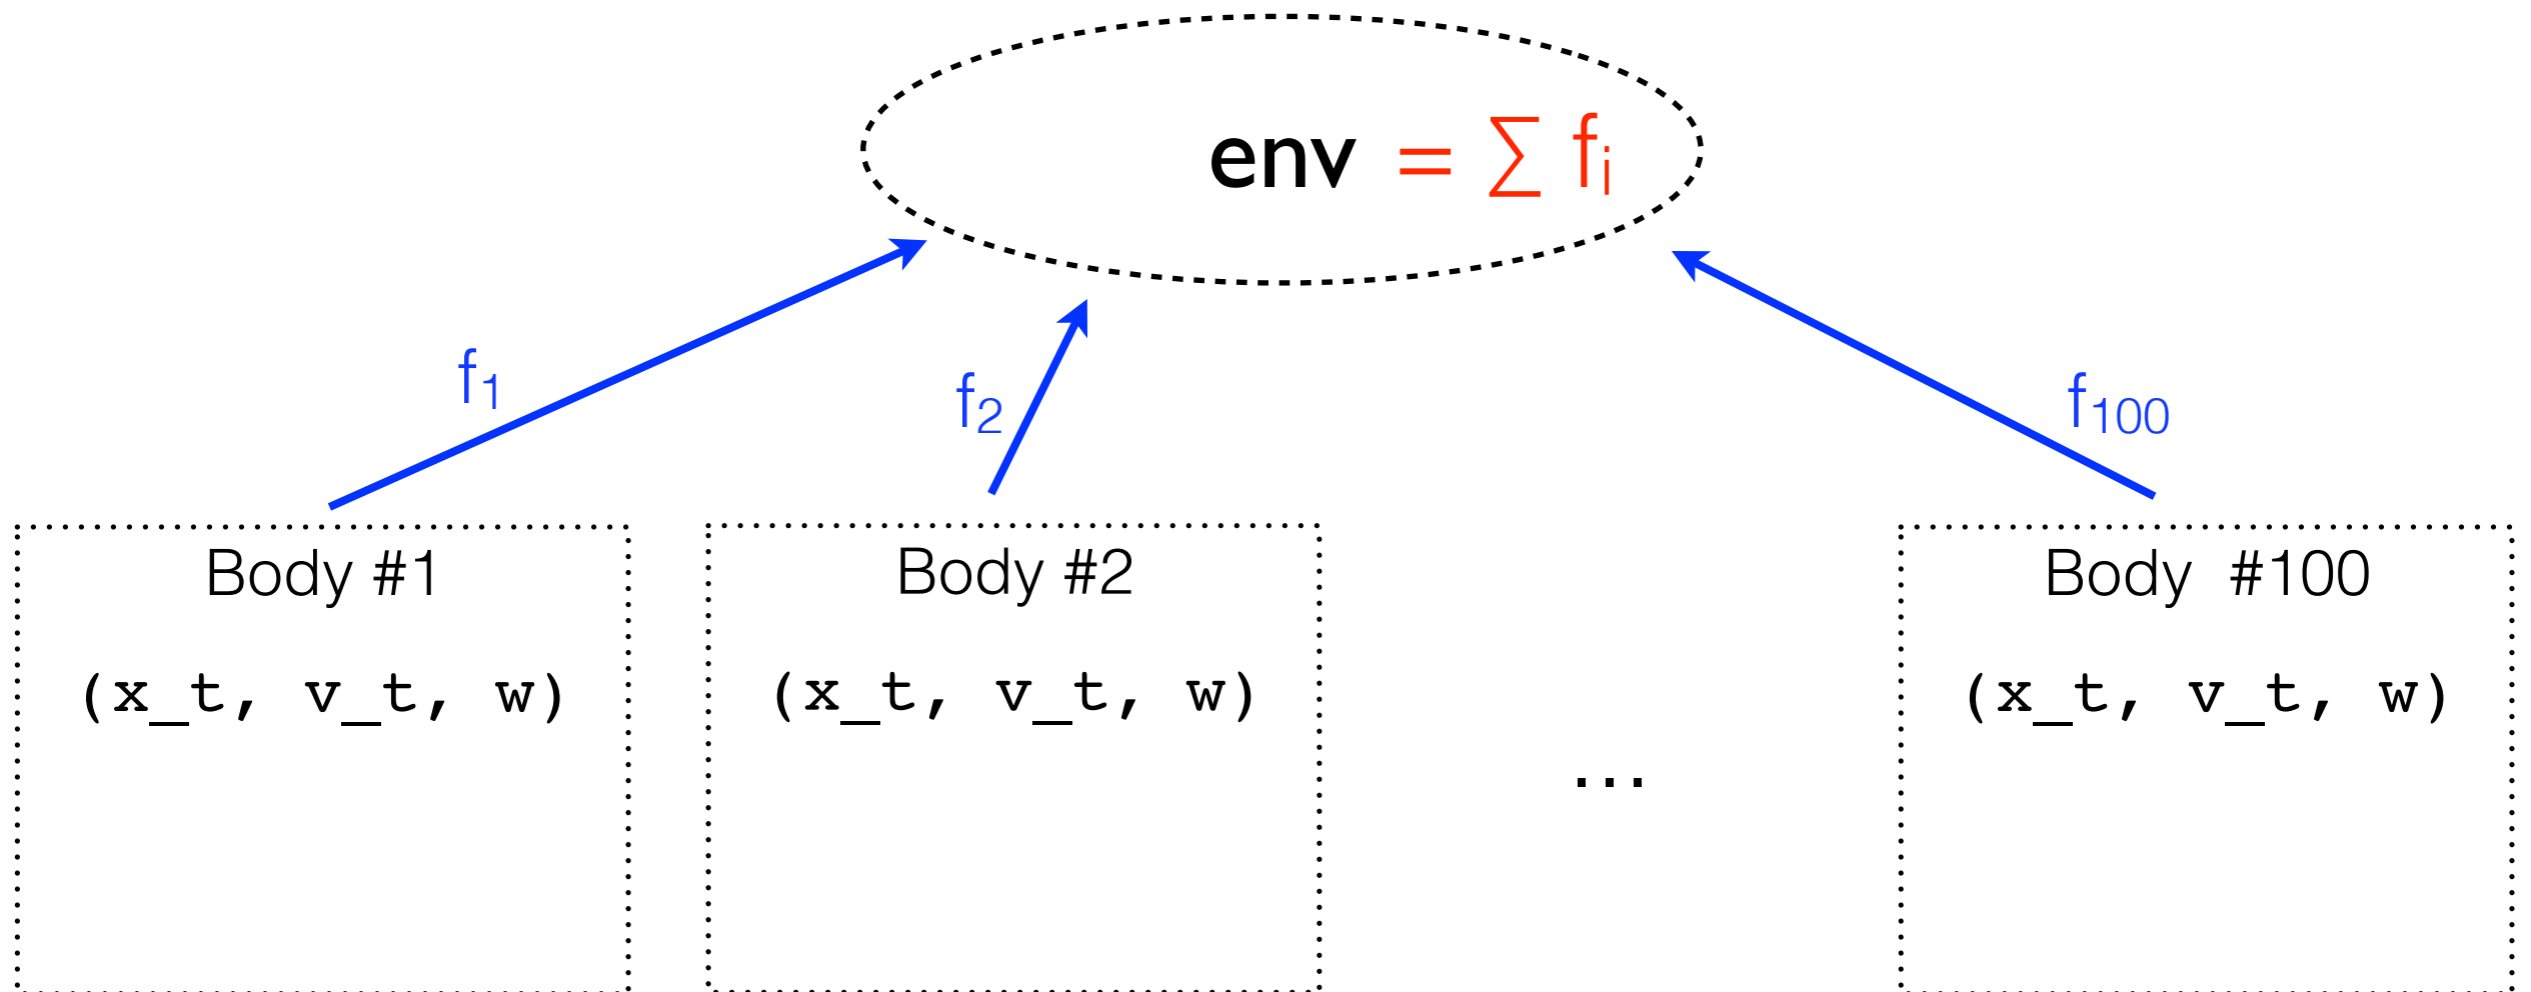

- ▶ One process per body
- ▶ A global signal

N-body in ReactiveML

- ▶ One process per body
- ▶ A global signal

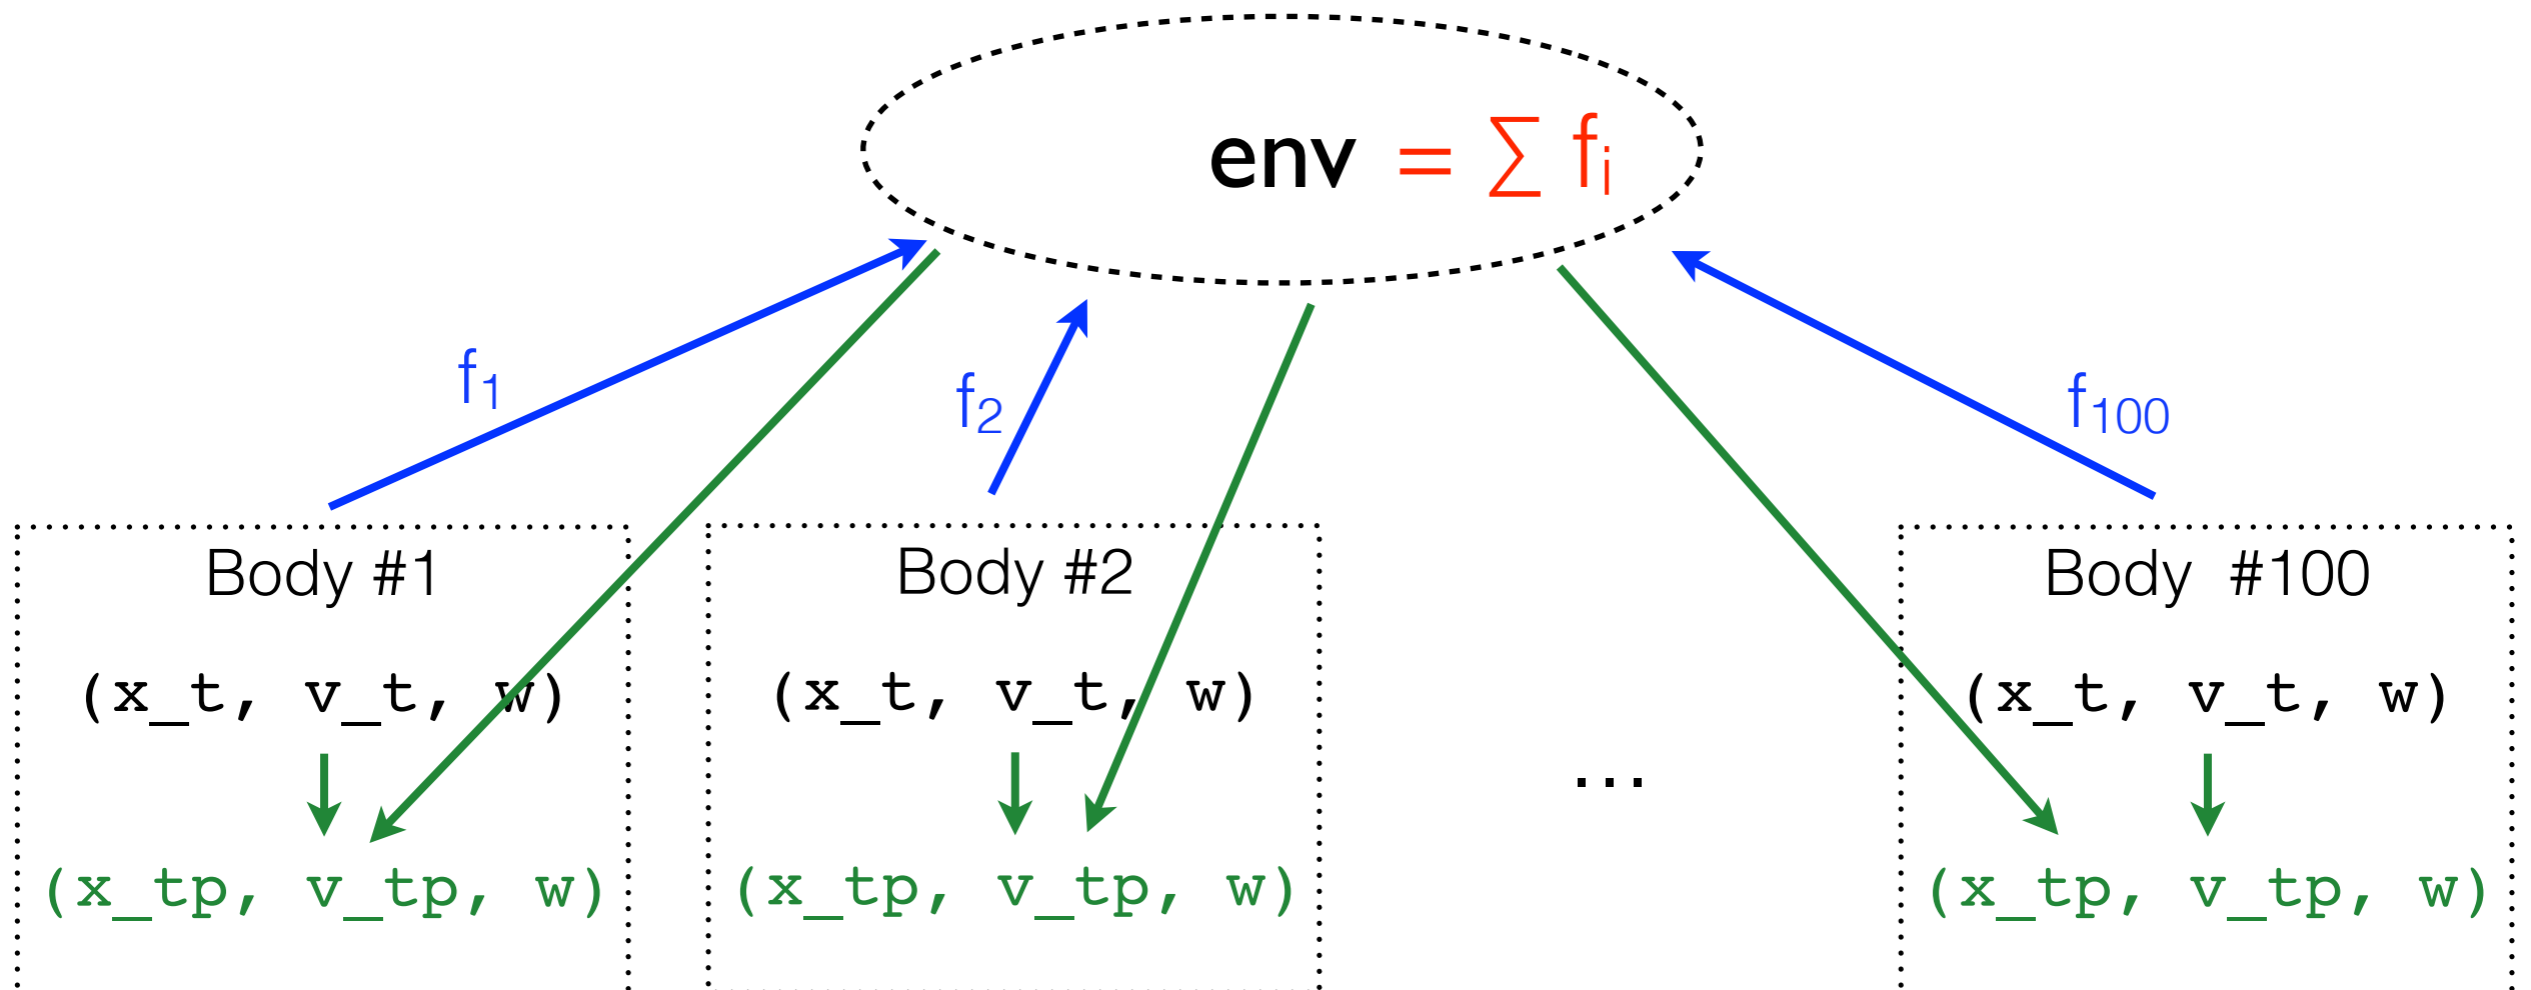

1. Send force
2. Collect forces

N-body in ReactiveML

- ▶ One process per body
- ▶ A global signal

1. Send force
2. Collect forces
3. Compute new position

N-body in ReactiveML

```
let dt = 0.01
signal env default (fun _ -> zero_vector)
        gather add_force

let rec process body (x_t, v_t, w) =
  emit env (force (x_t, w));
  await env(f) in
  (* euler semi-implicit method *)
  let v_tp = v_t ++. (dt **. (f x_t)) in
  let x_tp = x_t ++. (dt **. v_tp) in
  run body (x_tp, v_tp, w)

let process main =
  for i = 1 to 100 dopar
    run body (random_planet ())
  done
```

Introduction

Synchronous languages

Beyond embedded systems: ReactiveML

My work: Time refinement

Different time scales

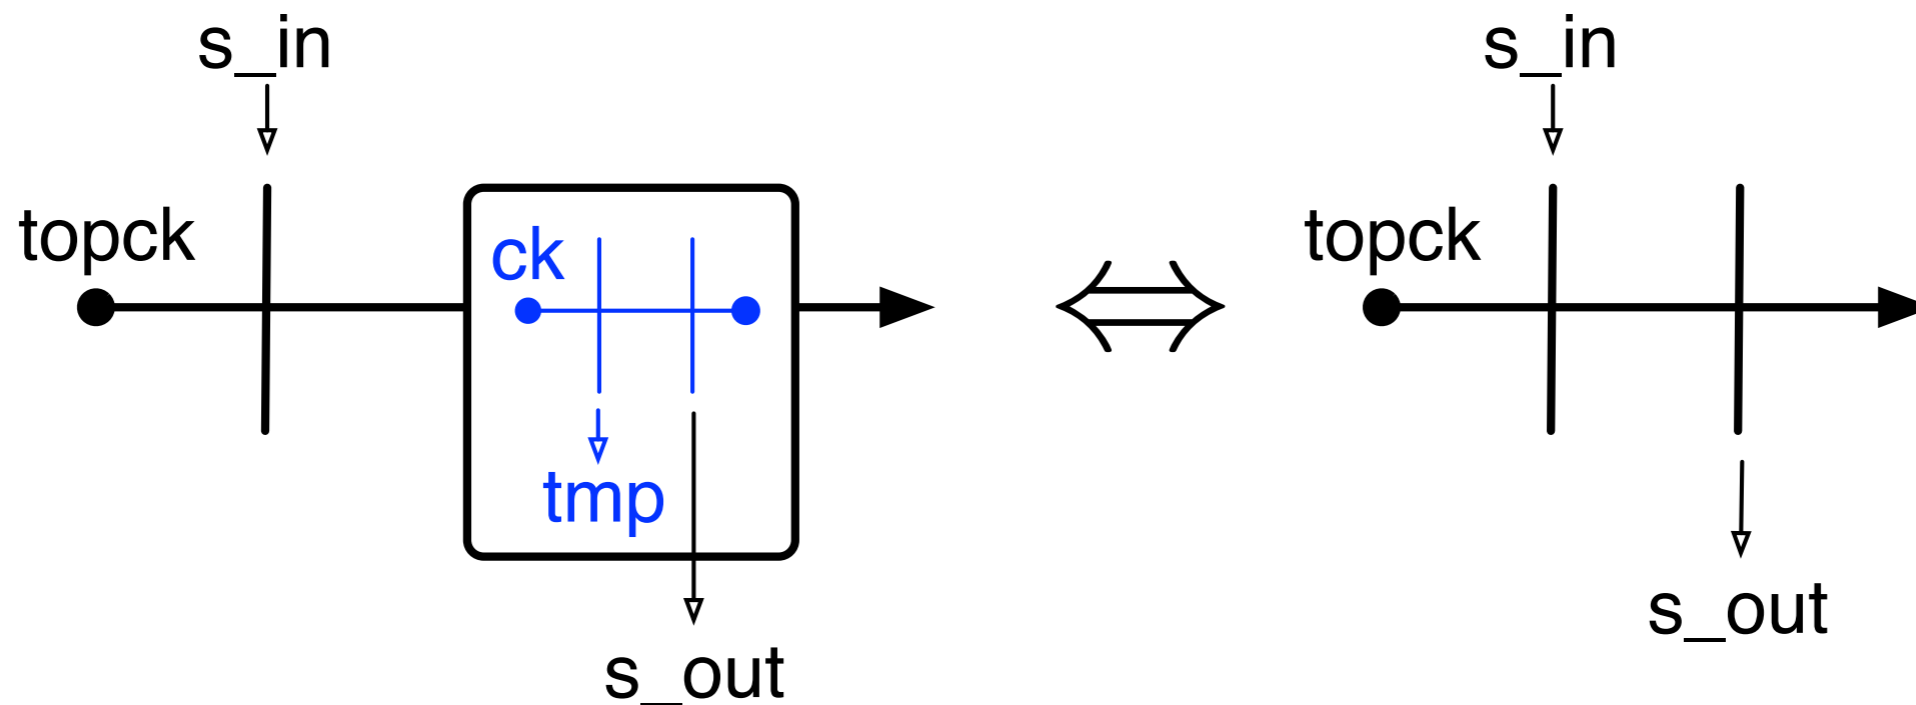

- ▶ Example: network of sensors
 - Internals of each sensor (microseconds)
 - Communication on the network (seconds)

Refinement

- ▶ Replace a process with a more detailed version
- ▶ Do not change the observable behavior

Reactive domains

- ▶ Local instants
- ▶ Invisible from the outside of the domain

Multiple steps integration methods

- ▶ eg Runge-Kutta
- ▶ one computation step = one local instant
- ▶ Switch method on-the-fly

Adaptive integration

- ▶ Compute in several steps
 - New positions
 - Estimate of the error
- ▶ If error too big, take a smaller time step

Two reactive domains

- ▶ One for computation steps
- ▶ One for the different tries

Course by Gerard Berry, College de France

First lesson

- ▶ L'informatique du temps et des événements
- ▶ March 28th 2013 18:00

Courses and seminars

- ▶ On Tuesdays, at 10:00

Programming languages should deal with

- ▶ Time
- ▶ Concurrency
