ap_fixedasian_turnbullwakeman

Output parameters:

- Price
- Delta

Description: Fixed Asian options are priced with Turnbull-Wakeman method that gives the Edgeworth expansion around a lognormal distribution using the first four moments of the logarithm of the arithmetic average[2]

/*Scaling of parameters */

/*Computation of the first four moments */

/*Computation of cumulants of the arithmetic average*/

/*Computation of lognormal density and its derivatives*/

/* Fit the parameters meanlog,v of lognormal distribution */

/*Levy Formula*/

Fixed Asian options are priced with Levy method[1]. /*Edgeworth Adjust-

ment : Computation of theoretical moments of the lognormal density*/

/*Edgeworth Adjustment : Computation of theoretical cumulants of the

lognormal density*/

/* Call Price */

Taking the Call price formula from [2]

. /* Put Price from Parity*/

Simple calculus give the call-put parity relationship

$$P_{T,t}(K) = C_{T,t}(K) + K * \exp(-r * (T - t)) - S(t) * \exp(-r * (T - t)) * (\exp(-(r - \text{divid}) * (T - t)) - 1) * \frac{1}{(T-t)*(r-\text{divid})}$$

/*Delta for call option*/

Here we derive the formula from [1] with respect to the variable $S(t)$

/*Delta for put option*/

We use again the call-put parity relation

$$\Delta_P = \Delta_C - \exp(-r * (T - t)) * (\exp(-(r - \text{divid}) * (T - t)) - 1) * \frac{1}{(T-t)*(r-\text{divid})}$$

/*Price*/
/*Delta */
